Keymacro, an application that lets you manage macros in your scripts, is simple and easy to use. It can be quite effective for taking some code and automatically filling up the whole file with the same one, by clicking once. Compatibility macOS 10.10 and above. Supported languages You can input most languages supported by OS X, including C, C++, Objective-C, Perl, JavaScript, JavaScript, Python, PHP, and Ruby. Macro manager It's very easy to input macros. The implementation is simple, fast, and intuitive. All you need to do is insert a variable, double click on it, and choose the desired action from the open menu. You can also apply multiple macros in one go, with your mouse. Code editor An editor is available for you to rearrange, and highlight the sections you'd like to work on. After choosing the right tab, you can even include your own code snippets and have them included in the scripts automatically. Search It's simple and easy to search for what you need, such as a word or a specific line. The whole process is also straightforward. That's the beauty of Keymacro. Limitations It supports a lot of languages, but sometimes when I test, the tools don't work properly. Not all languages seem to be supported. When I test it out, it seems as if it supports almost all languages but sometimes when I test, it doesn't seem to support the language. Comments Other reviews have noted this, but I can't really comment on it since I only use it for about 2 minutes and I'm not really that good at it yet, so I can't really say anything about the code comments. Why I gave the application a 7 I used it for less than 5 minutes and I have used a much better tool for that amount of time. Summary Keymacro is a simple, easy to use application for the macOS. It's effective for taking some code and automatically filling up the whole file with the same one. PILOT is a tool for managing your video downloads.
